

90-Day Entry Plan

GEO OWL | INFORMATION ENVIRONMENT ANALYST

Russell Dudek
Map the delta before it
becomes the decision.

ENTRY PRINCIPLE

Build mission fluency through controlled repetitions, then expand speed and ownership.

The first 90 days reduce uncertainty about mission standards, source quality, local context, reporting expectations, and the boundaries of LLM assistance. The sequence favors rapid learning, visible calibration, and measurable reliability.

DAYS 1-15 | ORIENT TO MISSION AND STANDARDS

Learn JCO tasking rhythm, shift expectations, acknowledgment rules, Site Lead escalation preferences, required SITREP/Rapid Recap/AAR formats, source restrictions, approved tools, and action-worthy change thresholds.	Produce Personal mission glossary, product checklist, decision-cue template, improvement register, and shadow products reviewed against experienced analyst output.
--	---

DAYS 16-30 | BUILD THE LOCALIZED BASELINE

Map the terrain Regional sources, hard-to-access channels, keywords, spelling and language variants, hashtags, recurring events, known actors, normal narrative families, sentiment ranges, discourse patterns, content velocity, audience-response behavior, source reliability, local legitimacy, latency, and blind spots.	Validate the baseline Compare public signals with operator and partner feedback where permitted; document ambiguity and alternatives; define provisional indicators and confidence thresholds; review assumptions with the Site Lead and experienced analysts.
---	--

FIRST-MONTH MEASURES

Tasker response discipline	Acknowledgment and course-of-action stated inside required window.
Format compliance	Products accepted without avoidable structural rework.
Source-map completeness	Critical source classes, language variants, ownership, and blind spots documented.
Judgment calibration	Differences between shadow assessment and experienced analyst assessment reviewed explicitly.

Operate, Measure, Recalibrate

DAYS 31-90

DAYS 31-60 | OPERATE DUAL-TRACK

Manual analytical track

Collect, validate, interpret, and write products using the approved analyst process. Preserve source traceability, state uncertainty directly, and record why a cue was issued, held, expanded, or escalated.

LLM-assisted track

Use approved LLM tools for extraction, structuring, comparison, and draft acceleration. Compare manual and assisted products for latency, omissions, unsupported claims, context loss, and correction burden. Log material overrides.

Gate: Automation earns broader use where it improves speed without degrading provenance, localization, confidence discipline, or analyst accountability.

DAYS 61-90 | OWN THE SHIFT AND LEARNING LOOP

- Manage assigned taskers with continuous operational presence and visible timing commitments.
- Deliver concise, decision-ready SITREPs, Rapid Recaps, and AARs within defined windows.
- Use recurring false positives, missed signals, source gaps, and override reasons to update the baseline and workflow.
- Propose bounded improvements tied to measured analyst friction or operator value.
- Demonstrate when to operate manually because the scenario exceeds automated capability.

90-DAY SCORECARD

Responsiveness	Tasker acknowledgment and time-to-cue	Faster without premature certainty
Analytical quality	Corrections, reversals, provenance gaps, missed alternatives	Down
Localization	Use of regional language, local actors, trusted sources, and cultural context	Up
Operator value	Updates that changed watch, collection, messaging, escalation, or continuation decisions	Up
Automation control	Logged overrides, abstentions, and repeatable safe accelerations	More explicit and evidence-based
Learning speed	Time from recap/AAR finding to updated baseline, prompt, source map, or standard work	Down

DAY-90 REVIEW QUESTIONS

- 1 Can Russell own a defined shift with reliable timing, quality, and judgment?
- 2 Are products concise, traceable, culturally grounded, and decision-useful?
- 3 Has LLM assistance reduced cycle time without increasing correction risk?
- 4 Which source, language, or tradecraft capabilities should deepen next?
- 5 What scope is ready to expand?
